

**ABSTRACT**

5 The present invention relates to a method for congestion control when setting up calls in a cellular CDMA-based communication system. A call setup request from a user equipment in a congested cell is prohibited by means of  
10 broadcasted call admission messages. However, the call admission information indicates permitted and/or restricted accesses for carrier frequencies and/or neighboured cells. Neighboured cells using the same carrier frequency as the congested cell are marked with a restricted access flag. Therefore, the user equipments in the congested cell will  
15 request for a call setup only in one of those neighbour cells without access restrictions. By this means, the user equipments will not contribute to the interference level in the congested cell.
